# Today's "centralised" electricity system

Large distant power plants supply almost all customers. In Australia the average efficiency is 33.1%

Transmission losses

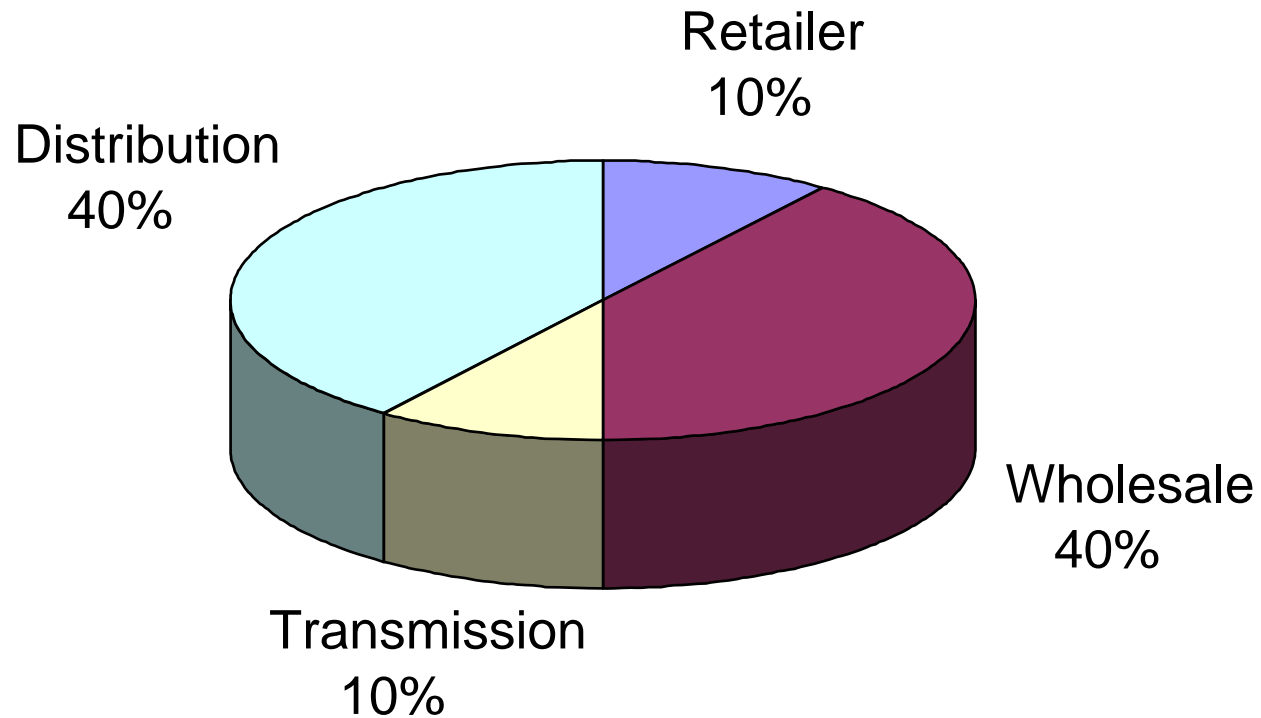

Distribution losses

Effective energy utilisation ~ 28.5%

# “Distributed” generation avoids 50% of your bill

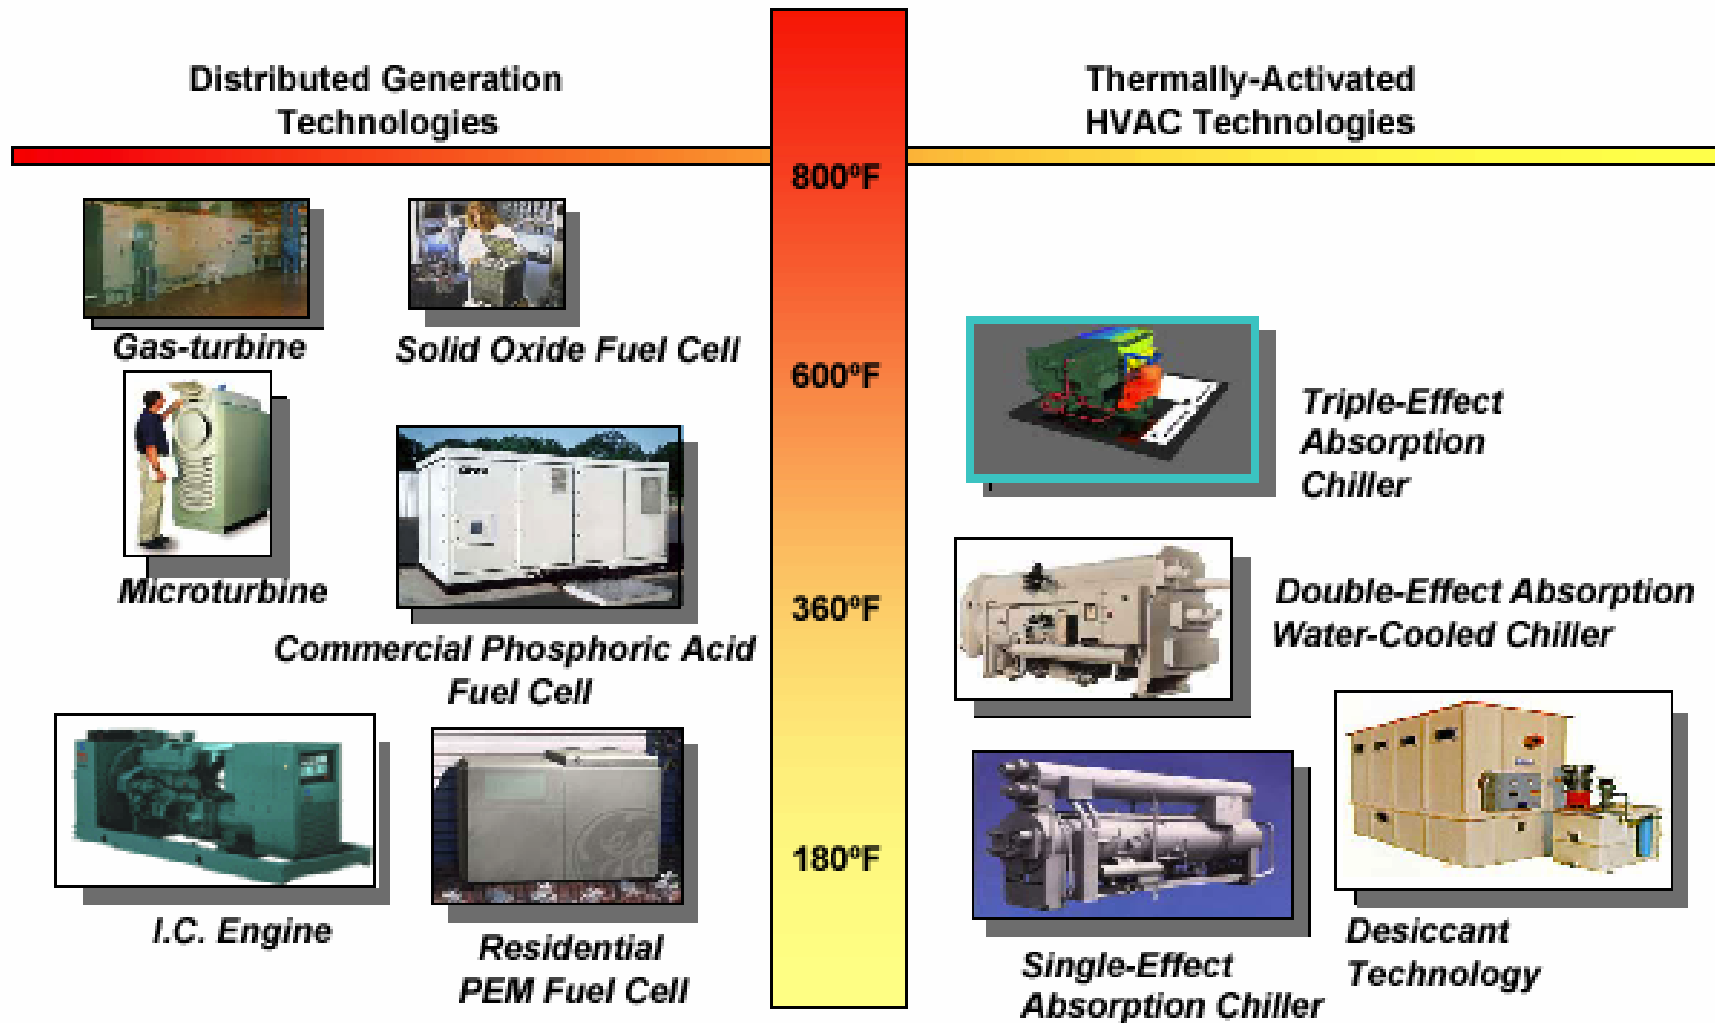

(IPART, 1999)

# New distributed power generators

Type	Typical Size	Efficiency
Solar photovoltaic/ thermal	up to 3 kW	Renewable
Wind turbine	30kW – 2MW	Renewable
Reciprocating engines	5kW – 5MW	25-40%
Microturbine	30 – 500 kW	20-35%
Fuel cells	5 – 50 kW	35-55%
Stirling/ Rankine engines	0.5 – 3 kW	10-25%

# Heat from distributed generation is useful

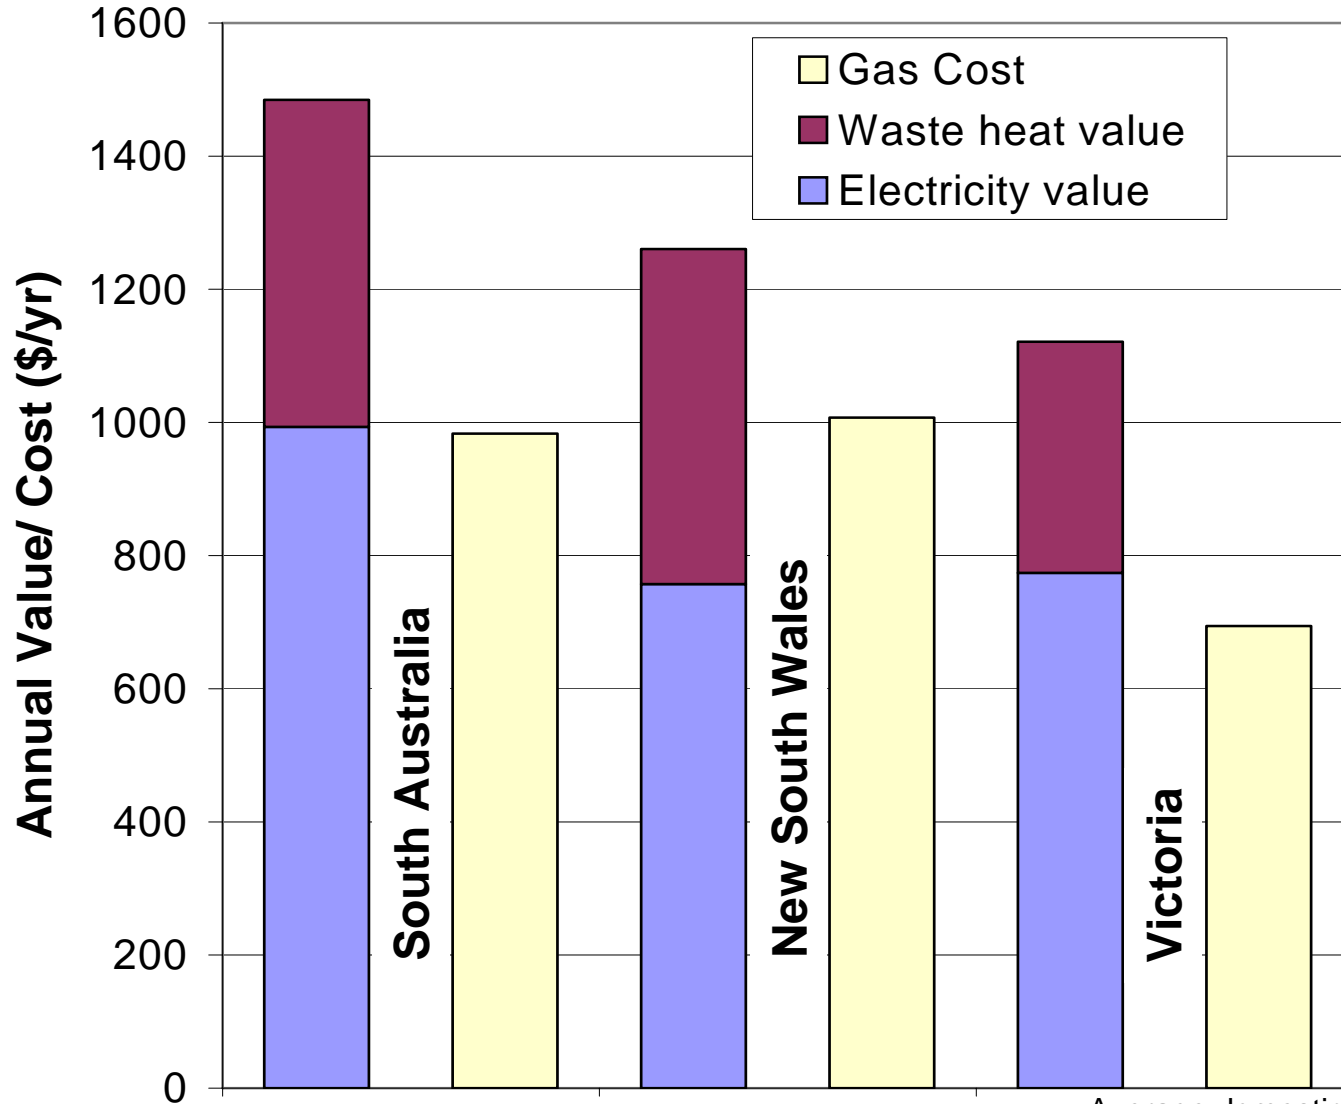

**Recoverable Energy Quality (Temperature) and HVAC Technology Match**

# But gas is expensive too

- Waste heat is a necessary extra revenue stream

Average domestic house (4500kWh)  
Generator electrical efficiency = 30%  
Assumed 100% waste heat utilisation

# Waste heat research

## Application

Heat transport/ transfer

Heat conversion

- Cooling
- Electricity
- Desalination

Industrial processes

## Science

Nanoscale materials

- Catalysts, structures, interfaces

Materials fabrication

Thermal design

# Hornsby trigeneration

## Project Goals

Large reduction in CO<sub>2</sub> emissions at a single site

Showcase energy efficiency

## Location

Hornsby City Library, Sydney

## Method

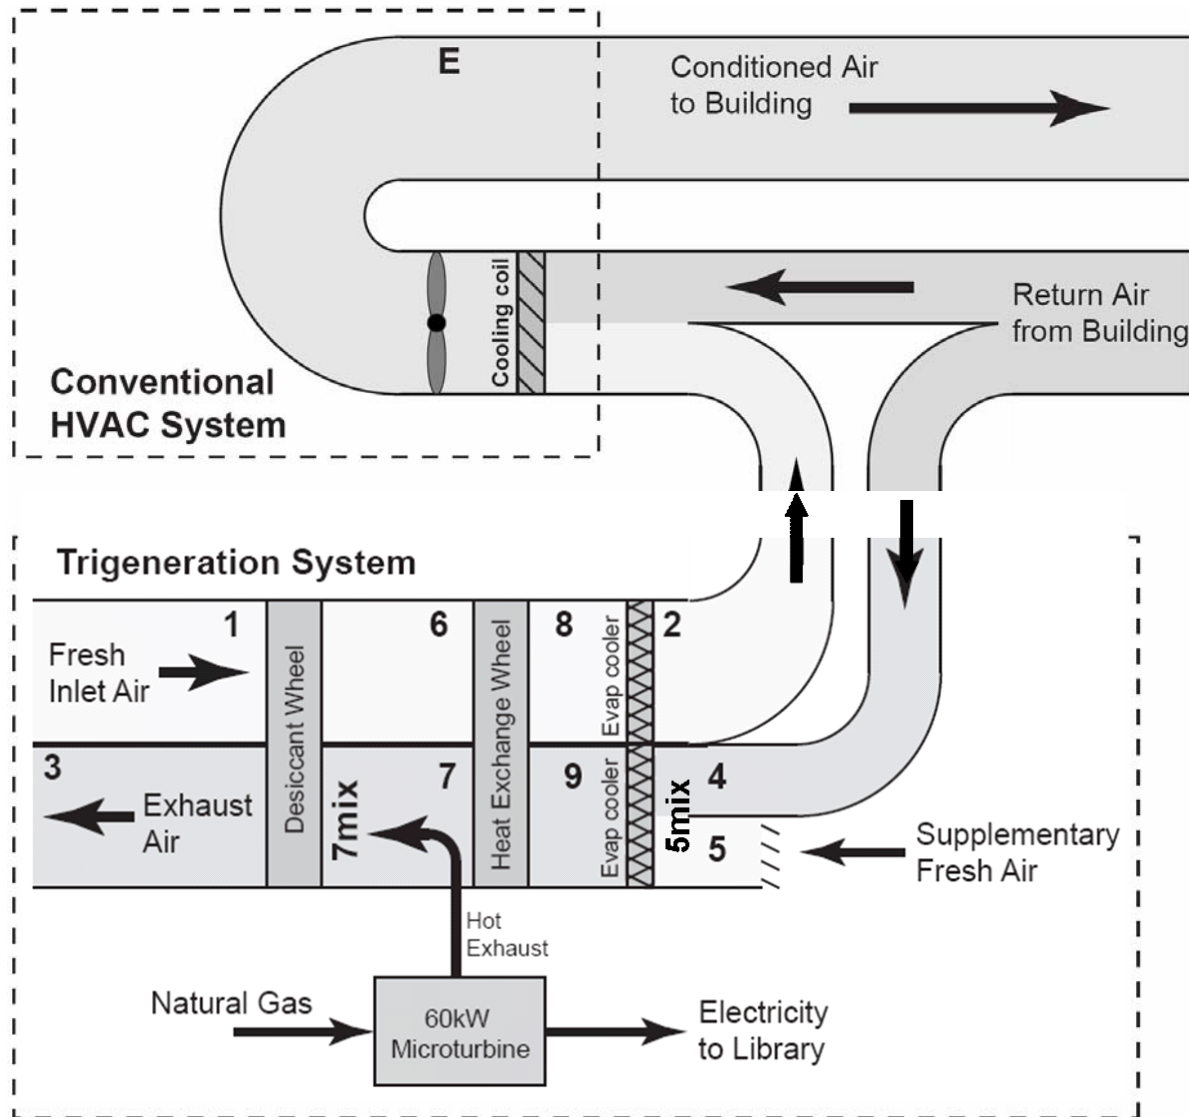

Trigeneration (power and cooling)

- Microturbine
- Desiccant cooling

# Tri-generation schematic

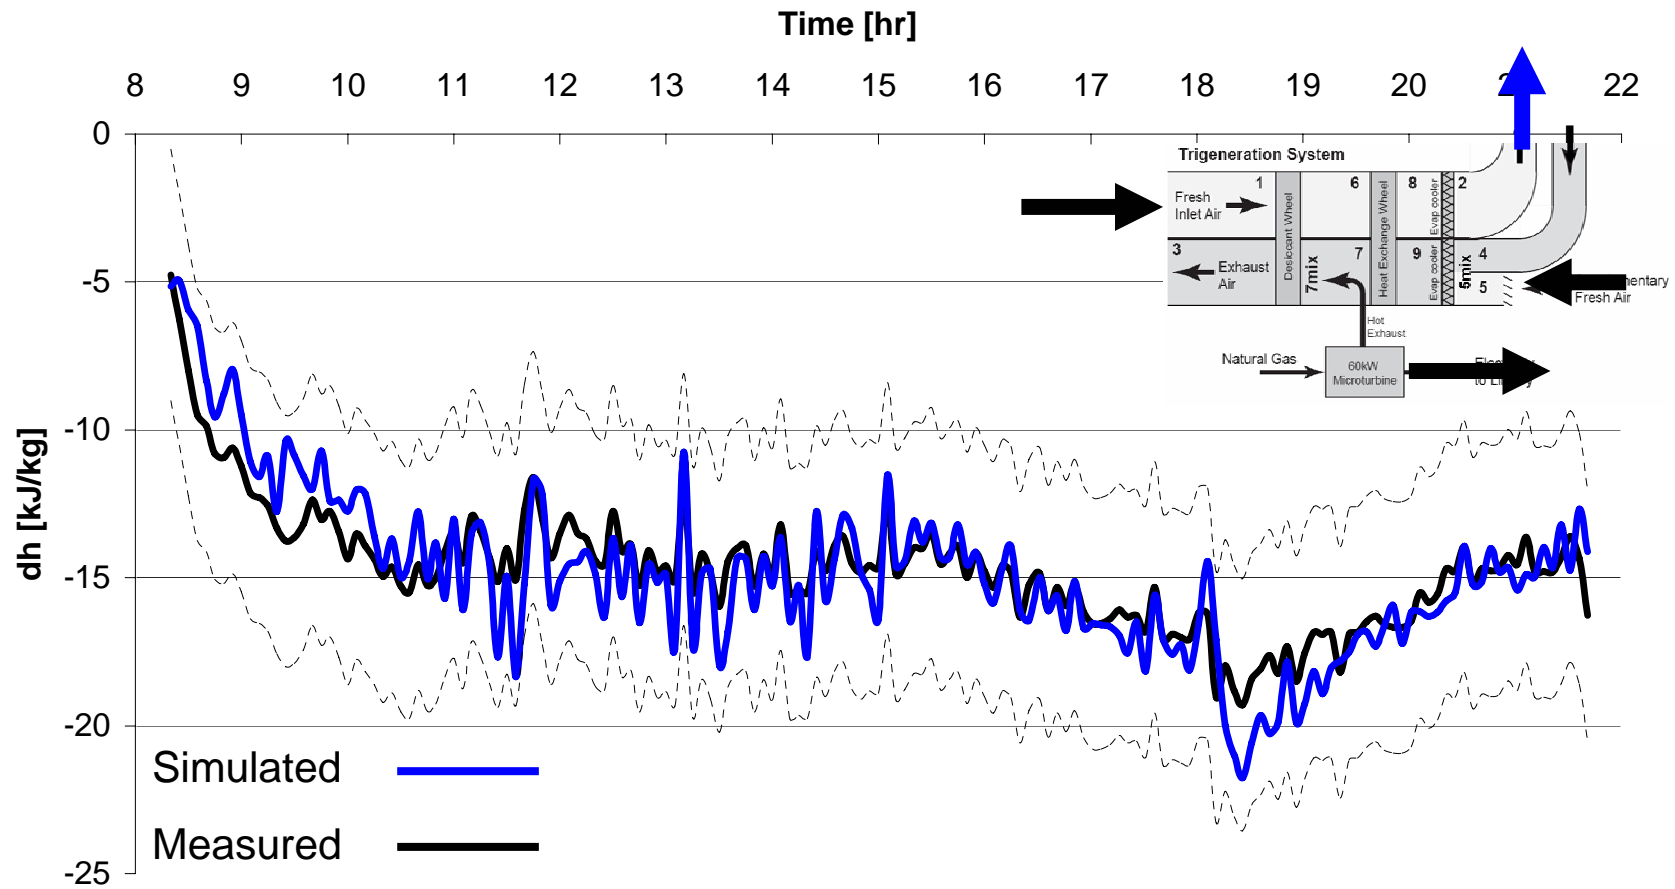

# Trigeneration system during construction

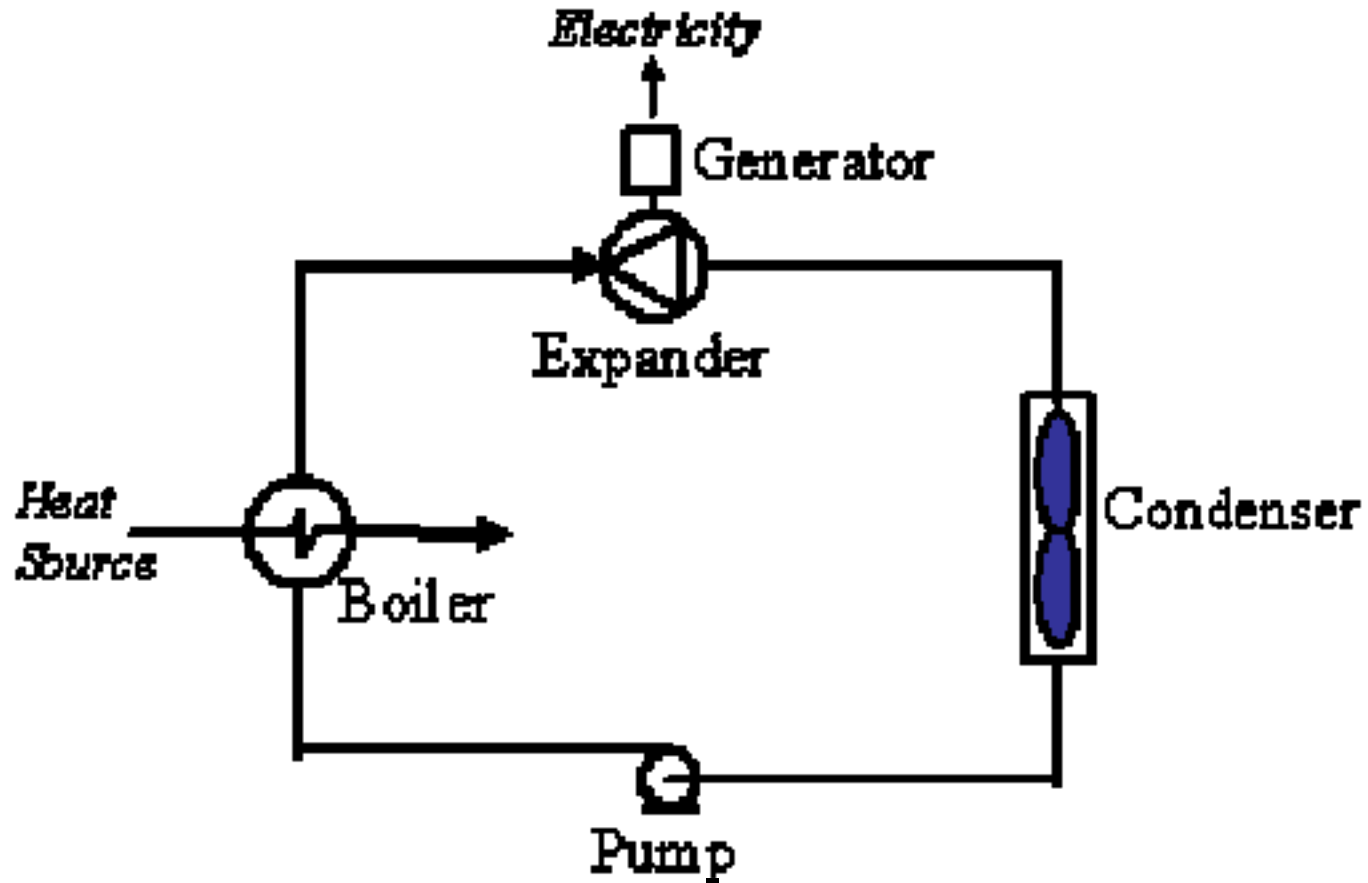

# Desiccant system model validation

Enthalpy removed from the fresh supply air stream

# Organic Rankine cycle

## New Rotary Expander

### Patented technology development

#### Benefits

- Simplicity/ robustness/ cost
- Efficiency
- Flexibility
- High capacity

## Rotary Scroll

### Immediate availability

- Semi hermetic
- Low noise
- Oil free ?

# Thermoelectric power generation

## - The ZT challenge

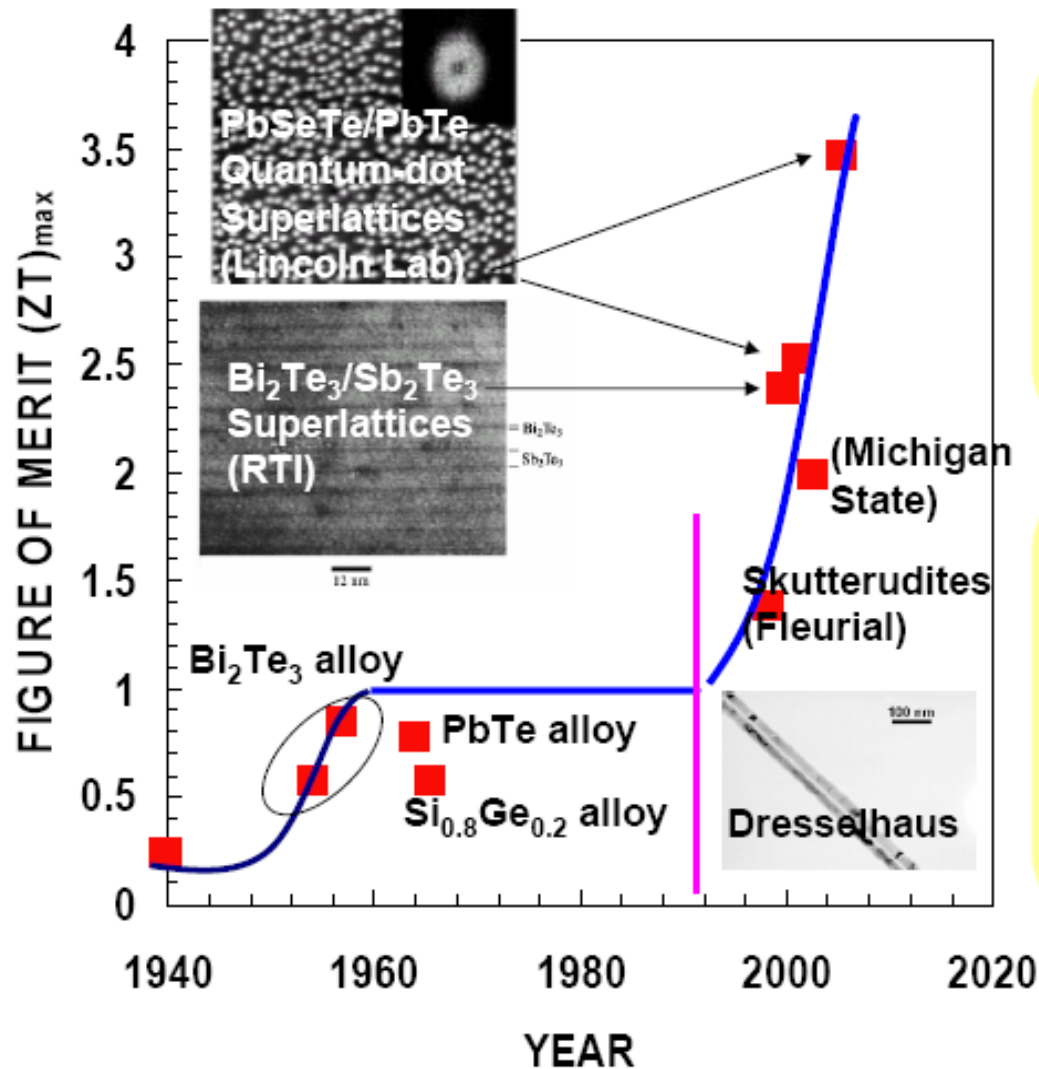

### Nondimensional Figure of Merit

$$ZT = \frac{\sigma S^2 T}{k}$$

Joule Heating  $\rightarrow$   $\sigma S^2 T$   
 Seebeck Coeff. Electron Cooling  $\rightarrow$   $S$   
 Reverse Heat Leakage Through Heat Conduction  $\rightarrow$   $k$

# Progress in the challenge

PbTe/PbSeTe	Nano	Bulk
$S^2\sigma$ ( $\mu\text{W}/\text{cmK}^2$ )	32	28
$k$ (W/mK)	0.6	2.5
$ZT$ (T=300K)	1.6	0.3

Harman et al., Science, 2003

Bi <sub>2</sub> Te <sub>3</sub> /Sb <sub>2</sub> Te <sub>3</sub>	Nano	Bulk
$S^2\sigma$ ( $\mu\text{W}/\text{cmK}^2$ )	40	50.9
$k$ (W/mK)	0.6	1.45
$ZT$ (T=300K)	2.4	1.0

Venkatasubramanian et al., Nature, 2002.

# What could the future look like ?

Figure 4.5: Reductions in CO<sub>2</sub> emissions from 2005 level by 2025 – by energy source  
How the different decentralised energy technologies contribute to the CO<sub>2</sub> savings

Technology type

CO<sub>2</sub> savings under the Low DE scenario (%)

Figure A. For the existing building stock Efficient use of gas through widespread use of gas-engine CHP (and associated Community Heat networks) dominates the CO<sub>2</sub> savings from existing properties. Biomass as a fuel becomes significant with building integrated low and zero carbon technologies making a marginal contribution.

Figure B. For the new build properties Renewable technologies account for over half of the CO<sub>2</sub> savings when they incorporated in to new buildings.

## **Energy Technology**
